AI Assignment #1

CISC3024 Pattern Recognition

September, 2026

This course has three AI assignments to train students to use AI tools/agent to efficiently search and implement algorithms to solve real-world pattern recognition problems.

AI Assignment # 1 aims to find a recent algorithm of Deep CNN or Deep Autoencoder with an application in computer vision and pattern recognition. You are expected to use an AI tool (like Deepseek or ChatGPT) or an AI agent to do everything for you, including, but not limited to, algorithm searching, programming, and even report writing.

A report with detailed steps on how you did this assignment should be submitted online via UMMoodle **next week** and then go through a Turnitin similarity check.

Note: You are NOT allowed to write any code by yourself!
